**NatureServe:**

**Introduction**

Pond snails, genus Stagnicola, is a genus of air-breathing freshwater snails in the family Lymnaeidae. These snails have a spiral shell that is up to 5 cm in length with a dextral (left-opening) shell (Thorp and Rogers 2011). Pond snails are distributed across North America (NatureServe 2016). Of the 28 species and subspecies known from North America, 9 (32%) are considered critically imperiled or imperiled (G1/T1 or G2/T2). Aquatic snails are scrapers that eat algae, microbes, fungi and detritus on solid surfaces such as logs, macrophytes and rocks (Smith 2001). Eight species of pond snails are known from Wyoming: S. apicina, S. bonnevillensis, S. caperata, S. catascopium, S. elodes, S. hinkleyi, S. montanensis and S. traski (NatureServe 2016). Of these species, S. hinkleyi was listed as imperiled and S. bonnevillensis, S. montanensis and S. traski were listed as vulnerable (NatureServe 2016). S. traski was recorded from one location in Wyoming (Oliver and Bosworth 1999). S. bonnevillensis is thought to be extirpated from southwest Wyoming and was a candidate species under the Endangered Species Act (NatureServe 2016).

**Habitat**

Pond snails live in ponds or slow moving streams. These snails may live on the bottom of ponds or streams on fine sediment or on aquatic vegetation (Thorp and Rogers 2011).

**Problems**

- Lack of basic information on the species present, their distribution, and ecology in Wyoming

**Conservation Actions**

- Concerns over the effects of habitat disturbance, such as dewatering, pollution, and invasive animals

**Monitoring/ Research**

Monitoring plans for some species may be desirable, but baseline information is first needed.

**Recent Developments**

Aquatic snail surveys are currently being conducted in some areas of Wyoming.
