HUNTERS, WE NEED YOUR HELP!

CHRONIC WASTING DISEASE
MONITORING AND SURVEILLANCE

Since 1997, Wyoming Game and Fish has been monitoring the distribution and prevalence of chronic wasting disease (CWD) to better understand how this disease affects the health of Wyoming’s deer and elk populations. This disease has now been identified in most of Wyoming. Continued monitoring of CWD over time is important to help understand the potential impacts of the disease as well as evaluate management actions for deer and elk. This will be a challenge, as collecting samples for valid estimates of prevalence requires large sample sizes in focused areas across the state. The Game and Fish Wildlife Health Laboratory has limited testing capacity to monitor CWD across the entire state, so focused sampling will rotate hunt areas each year.

* Hunters are very important in helping understand CWD and achieve monitoring goals. Game and Fish is asking that if you harvest a deer or elk in the hunt areas listed below, please submit a sample for testing to help achieve our goals. Hunters outside of this year’s focused surveillance areas can still submit a sample for testing.

CWD MONITORING DEER FOCUS AREAS

CWD MONITORING ELK FOCUS AREAS

THERE ARE SEVERAL WAYS TO GET YOUR HARVESTED ANIMAL TESTED:

- **Game check station** – Personnel are normally available to sample your harvested animal for CWD.
- **WGFD regional office** – You may have to leave the head if personnel are not immediately available.
- **Collect it yourself** – Collect a sample yourself by watching the online video, complete a submission form and send to the Wildlife Health Lab. Please visit wgfd.wyo.gov/CWD for instructions and more information.
- **Results from WGFD surveillance are usually available online within 3 weeks.**
- **If you want results within 10 working days, contact the Wyoming State Veterinary Lab in Laramie at (307) 766-9925 ($30 fee).**
- **Quarter and freeze your animal until test results are returned to save on meat processing costs if your animal is positive.**

Conserving Wildlife, Serving People
WHAT DO DEER AND ELK WITH CWD LOOK LIKE?
Early in the disease, animals show no clinical signs. Later on, affected animals show weight loss, reluctance to move, excessive salivation, droopy ears, increased drinking and urinating, lethargy, and eventually death. Not all animals will show the typical signs of CWD. The majority of all CWD-positive animals that are harvested appear completely normal. The only way to know whether your harvested animal has CWD is to have it tested.

HOW IS CWD TRANSMITTED?
Evidence suggests that CWD is transmitted via saliva, urine, feces, or even infected carcasses. Animals may also be infected through the environment via contamination of feed or habitat with prions (which can persist for 10+ years).

HOW OFTEN DOES IT OCCUR?
The prevalence of CWD is higher in deer than elk, and tends to be higher in bucks than in does. In Wyoming, CWD is most prevalent in the southeastern quadrant and within the Bighorn Basin. Over the past 30 years, Wyoming has seen CWD prevalence increase in many hunt areas across the state.

HOW DOES CWD AFFECT DEER, ELK, AND MOOSE POPULATIONS?
Research suggests that CWD can lead to declines in some deer and elk populations at high prevalence. Additional data suggests that CWD can decrease the number of older bucks in a population. There is currently no data to indicate that this disease will have population impacts in moose.

IS IT SAFE TO EAT A CWD INFECTED ANIMAL?
To date, there have been no cases of CWD in humans and no strong evidence for the occurrence of CWD in people. However, experimental studies raise the concern that CWD may pose a risk and suggest that it is important to prevent human exposure. Therefore, the Centers for Disease Control and the World Health Organization recommend that CWD-positive animals not be consumed.

The information provided in this brochure is a direct action of the Wyoming CWD Management Plan.
